

## **Summary of Cancer Incidence and Mortality for Zip Code 29693 (Westminster, SC)**

### ***Cancer Incidence in Zip Code 29693***

The first step in the analysis of cancer data for zip code 29693 was to look at the number of new cancer cases diagnosed in the zip code and compare this to the number of cancer cases expected (see Table 1). This first step determines if there is anything unusual with cancer patterns in the area. The number of "expected" cancer cases is calculated by using South Carolina cancer rates and applying them to the population of the zip code.

Table 1 shows what types of cancer occurred in zip code 29693 from 1996-2000, and how many cancer cases were expected. Overall, there were fewer cases of cancer than expected. A total of 266 new cases of cancer occurred in the zip code, while 344 cases were expected. The most common types of cancer were lung, colon/rectum, female breast, and prostate cancers. These types of cancer are also the most common cancers occurring across all of South Carolina.

The analysis did not reveal any specific types of cancer where the number of cases was significantly higher than expected.

### ***Cancer Deaths in Zip Code 29693***

To assess cancer deaths in this zip code, cancer mortality data from 1997-2001 were used. The same process used to analyze new cancer cases was also used to analyze cancer deaths. Table 2 shows the number of cancer deaths that occurred and the number expected in the zip code. A total of 128 cancer deaths occurred in this zip code, while 161 deaths were expected. Therefore, fewer cancer deaths occurred than expected.

The analysis did not reveal any specific types of cancer where the number of cancer deaths was significantly higher than expected.

### ***Conclusions***

To summarize, fewer cancer cases and deaths occurred in zip code 29693 than expected. There were no cancer sites that were significantly elevated in cases or deaths.

In order for a true cancer cluster to exist, the number of cancers occurring must be more than would be expected by chance. Along with statistical testing, there are several other criteria that determine whether a true cancer cluster exists. First, a cancer cluster would more likely involve rarer types of cancer rather than more common cancers like lung or colon/rectum cancers. Also, a cancer cluster would occur with one specific type of cancer rather than having excesses in several different types of cancer.

Taking all these criteria into consideration, there is no evidence of cancer clustering or of an excess of cancers resulting from environmental exposures in zip code 29693.

For questions about this report, please contact Laura Sanders at the SC Central Cancer Registry.

**Table 1. Analysis of New Cancer Cases in Zip Code 29693, 1996-2000**

<u>Site</u>	<u>Observed No. of Cases</u>	<u>Expected No. of Cases</u>	<u>Observed/Expected</u>	<u>Chi-SquareTest*</u>
Lung/Bronchus	50	55.3	0.90	0.52
Colon/Rectum	36	39.6	0.91	0.33
Breast (Female)	33	49.4	0.67	5.44
Prostate	31	59.5	0.52	13.68
Bladder	15	13.6	1.10	0.15
Melanoma	10	11.4	0.87	0.18
Non-Hodgkin Lymphoma	10	11.2	0.90	0.12
Kidney/Renal Pelvis	8	8.7	0.92	0.06
Pancreas	7	7.7	0.91	0.07
Uterus	7	8.3	0.85	0.19
Oral/Pharynx	6	9.9	0.61	1.53
Stomach	5	5.4	0.92	0.03
Unknown/III-Defined	7	NA	NA	NA
All Sites	266	344.4	0.77	17.86

Excludes in situ cases of cancer to allow for comparison.

Cancer sites with less than 5 cases of cancer expected are not analyzed due to the unreliability of statistical tests based on small numbers.

\*The Chi-square statistical test allows us to determine if the difference between what is observed and what is expected is significant. If the value is greater than 3.84, then we are 95% confident that the observed number of cases is significantly different from the expected number of cases.
